

Dear Editor-in-Chief,

I am pleased to submit the manuscript titled "Position-Aware vs Semantic Chunking for Content Generation: Small Gains, Big Trade-offs" for consideration as an Original Research Article in IEEE Access.

This study addresses a practical gap in Large Language Model (LLM) literature: while document chunking is a ubiquitous preprocessing step in RAG and content generation, there is limited empirical guidance on which strategies actually improve downstream quality. This work provides this guidance through a controlled evaluation of four chunking methods across 101 research papers.

Key Contributions:

Empirical Benchmarking: I demonstrate that simple truncation outperforms or matches sophisticated chunking methods (semantic breakpoint, position-aware) for document-to-slide generation tasks.

Statistical Rigor: I provide statistical evidence (paired t-tests, effect sizes) quantifying the marginal differences between approaches.

Universal Limitations: I identify statistics retention as a universal limitation across all methods, suggesting this is a generation-side rather than chunking-side challenge.

The findings have immediate practical implications: practitioners can confidently utilize simple truncation instead of complex chunking pipelines, reducing system complexity without sacrificing quality.

Declarations:

This manuscript is original, has not been published elsewhere, and is not under consideration by another journal.

A version of this work has been posted as a preprint on TechRxiv.

I confirm that there are no competing interests to disclose.

All data and evaluation code will be made publicly available via GitHub upon acceptance.

Thank you for your time and for considering this submission.

Sincerely,

Gourav Singla

Independent Researcher
